NOTICE USE OF CHLORMINES

The City of Bynum purchases water from the Brandon – Irene Water Supply Corporation. The water is treated with chloramines prior to entering the Bynum water system. The use of chloramines instead of chlorine is intended to benefit customers by reducing the level of disinfection by products (DBPs) in the system, while still providing protection from waterborne disease.

However, chloramines can cause problems to persons dependent on dialysis machines. A condition known as hemolytic anemia can occur if the disinfectant is not completely removed from the water that is used for the dialysate. Consequently, the pretreatment scheme used for the dialysis units must include some means, such as a charcoal filter, for removing the chloramine. Medical facilities should also determine if additional precautions are required for other medical equipment.

In addition, chloraminated water may be toxic to fish. If you have a fish tank, please make sure that the chemicals or filters that you are using are designated for use in water that has been treated with chloramines. You may also need to change the filter that you use for fish tanks.
